### **Betaxolol ophthalmic**

#### What is betaxolol ophthalmic?

Betaxolol is a beta-blocker that reduces pressure inside the eye.

Betaxolol ophthalmic (for the eyes) is used to treat open-angle glaucoma and other causes of high pressure inside the eye.

Betaxolol ophthalmic may also be used for purposes not listed in this medication guide.

## Warnings

You should not use betaxolol ophthalmic if you have a serious heart condition or slow heartbeats.

Before taking this medicine

You should not use this medicine if you are allergic to betaxolol, or if you have:

- a serious heart condition such as "sick sinus syndrome" or "AV block" (2nd or 3rd degree);
- · severe heart failure; or
- · a history of slow heartbeats that have caused you to faint.

To make sure betaxolol ophthalmic is safe for you, tell your doctor if you have:

- asthma, severe chronic obstructive pulmonary disease (COPD);
- · a history of heart disease or congestive heart failure;
- diabetes;
- · a thyroid disorder;
- · a history of severe allergies;
- blood circulation problems or peripheral vascular disease such as Raynaud's syndrome;
- · a muscle disorder such as myasthenia gravis; or
- · a condition for which you take another beta-blocker medicine.
- It is not known whether this medicine will harm an unborn baby.
   Tell your doctor if you are pregnant or plan to become pregnant.
- It is not known whether betaxolol ophthalmic passes into breast milk or if it could harm a nursing baby. Tell your doctor if you are breast-feeding a baby.
