You can typically reset your washer by unplugging it, waiting 5-10 minutes, and
then plugging it back in. However, there are a few more obscure solutions that arent easy to find info on elsewhere online. In this article, well break all of it down. 1Unplug the power and wait one minute. Modern Whirlpool machines are computers, and the old turn it off and on again trick will reset them. Unplug the machine from the wall outlet and
wait 60 seconds before plugging the machine back in.[1] If the machine is hardwired into the wall or youd have to pull out the entire machine to access the outlet, just flip the main power breaker instead. If you see the word Cabrio on your
machines panel, see our section on Cabrios. 2If Loc is displayed, press and hold the control lock button. Most Whirlpool machines have a control lock designed to shut everything off and lock the door so kids cant climb into the drum. Its possible you hit this button by accident, so find the control lock button and press it. If nothing happens, press it and
hold the button for at least 5 seconds. Your machine should come back to life.[2]On some machines, youll see a little padlock logo pop on when the control lock, try pressing start or start/pause. Then, try holding them down for at least 5 seconds. If that doesnt work, find your manual and search
for the control lock info. Advertisement Turn the washer off but leave the power on. There appears to be a period in Whirlpool's history where they used a dial-based reset method, but those instructions appear to be relatively hard to find on their website. If you have a newer model but unplugging it and unlocking the control lock doesn't work, try
turning the cycle off.[3] Leave the power on the washer on, though. Then, perform the dial counterclockwise for 1 click. Turn the dial counter-clockwise for 1 click. Turn the dial clockwise for 1 click. Turn the dial clockwise for 1 click. Turn t

machines. Since completing this one is so easy, give it a shot! Open and close the lid rapidly at least 6 times in 12 seconds. Your machine may reset.[5] Advertisement 1Press pause/cancel, choose a cycle, then press start. If you have an older Whirlpool washing machine, youve probably got one of their Cabrio models. These were their most popular
line at the time, and many are still out there today. If your Cabrio isnt responsive or something seems off, start by pressing pause/cancel or pause. Then, select a wash cycle on the dial and hit the start button.[6]Whirlpool stopped making them around ten years ago, so if your washer feels like its on the newer side and you dont see Cabrio on the top
panel, its probably not a Cabrio.2Disconnect the power, plug it back in, and wait 10 minutes. Do not pause the cycle. Shut the machine down by pulling the plug out from the fuse box. Then, wait at least 10 minutes. [7]This interrupts the machines natural
cycle. It will force reset over the next 5-10 minutes as the electrical charge drains. 3Run an empty load to help the washing machine back into the wall or flip the circuit breaker. Then, run whatever wash cycle the dial is sitting on with nothing in the drum. The washing machine will be all good to go
after that load is finished.[8]If you cant get the cycle to run or the machine is still not running properly, it may be time to replace your washer. On average, washing machines only last around ten years, and thats about how old most Cabrios are at this point.[9] Advertisement 1Inadequate power Check your outlet to ensure your machine is plugged in
If it is, test the outlet itself by plugging a phone charger in to confirm it works. If the machine isnt turning on, its likely that the outlet does appear to
be working, try flipping the fuse on and off. If that doesnt fix the problem, contact an electrician to have the problem diagnosed by a pro.20verheated machine If you've been running too hot. Put your hand on the side of the machine. If its really
warm, youre probably close to blowing the washers engine out. The Solution: Wait a few hours. Give your machine a rest and wait for the heat to dissipate. In the future, try to avoid running more than 2-3 cycles in a row. If your engine still overheats, contact a repair company. 3Wrong cycle configuration If the control lock is activated or you
accidentally hit the delay start button, your washer wont activate even when you press the start button.[11]The Solution: Reset your cycle. If you dont know how (or why the machine locked in the first place), just unplug it and wait 10 minutes before plugging it back in.4Damaged door switch If you dont hear a little click when you close the door all
