However, there's a crucial consideration: locking wheel nuts and keys are often included in new vehicles to prevent alloy wheel theft. The three types of locking wheel nuts found in cars are: * Keyed head wheel nuts, featuring a keyed head that requires the matching key for removal. * Collar Rotating Collar, characterized by a spinning collar that makes it difficult to remove without the corresponding key. * Sheer head bolts, commonly seen on French vehicles like Peugeots, which "sheer" off if removed with any tool other than the correct key. These locking wheel nuts and keys aim to secure alloy wheels against theft. While this is less of a concern now due to widespread use of alloy wheels, vehicle manufacturers still provide these features as a security measure. Given text here The nuts on a wheel can be removed using a key. The required tools are a car jack, wrench for lugs, and lug nut socket set with a nut wrench. Common sizes of lug wrenches include 23mm, 19mm, and 17mm. Most nuts have conventional measures of 21mm or 19mm. To remove the bolts using the key, follow these steps: Step 1: Match the Key to the Lock Align the key's pattern with the lock and insert it into the slot. Step 2: Tighten the Wheel Bolt Turn the bolt securely keeping the key in place. Step 3: Let Go Remove the key. Step 4: Secure the Tire Wrench Place the wrench on the wheel bolt's end, gently crank and escalate pressure until it starts spinning, then unscrew. If you have misplaced the key, purchase a kit for wheel lock removal or use force by applying a lug nut socket set with a nut wrench, hammer, and breaking bar. For a kit: Determine the size of the socket, align, let go, repeat if necessary. For force: Get the car ready, select sockets, get ready to apply force, remove bolt, try again until successful or seek expert help Looking to recover your wheels bolt after completing a job, you'll need some basic tools like a vice, hammer, and chisel with a sharp edge. To remove the wheel nut, simply clamp it in a vice with the socket facing down, then use the chisel to whack it out. The cost of a wheel lock key can range from \$10 to \$120, depending on the level of security needed. While an inexpensive key may be sufficient for some users, those who plan to drive their car regularly may want to consider investing in a more expensive "high security" key. It's also a good idea to keep a spare key with your emergency kit or in an easily accessible location, such as a purse or wallet. Additionally, make sure to record the number of your wheel lock key and keep it safe, in case you need to order a replacement. The type of locking wheel nut used on different cars can vary greatly, so it's best to consult your owner manual or a qualified mechanic to determine what type of nut is used on your vehicle. Replacing a wheel lock key typically costs £45.99, though prices vary depending on the vehicle make and model. However, beware of unscrupulous traders selling low-quality copy keys. As approved suppliers of genuine wheel lock keys, we cater to most vehicles. The key itself is cylindrical in shape, made from steel, approximately 4 cm long, and 2 1/2 cm wide, with a hexagonal end fitting into the wheel wrench and a hollow end with a patterned insert for engaging the locking wheel nut. Each vehicle manufacturer installs unique locking wheel nuts that are not interchangeable between brands, ensuring wheels cannot be stolen. The 'Wheel Lock Key' is used to remove and install these locking wheel nuts during maintenance work. If you've lost your key, we can supply replacement keys for most vehicles without requiring security codes. Follow our simple three-step process to purchase a new key: Take an image of the security nut or bolt on your wheel, then enter it on our 'Checkout/Shop Page'.
