Beclomethasone Inhalation

What is beclomethasone inhalation?

Beclomethasone is a steroid. It prevents the release of substances in the body that cause inflammation.

Beclomethasone inhalation is used to prevent asthma attacks in adults and children who are at least 5 years old. This medication will not treat an asthma attack that has already begun.

Beclomethasone inhalation may also be used for purposes not listed in this medication guide.

Important Information

Beclomethasone inhalation will not work fast enough to treat an asthma attack. Use only a fast acting inhalation medicine for an asthma attack.

Before taking this medicine

You should not use beclomethasone if you are allergic to it. To make sure beclomethasone inhalation is safe for you, tell your doctor if you have ever had:

- any type of bacterial, fungal, or viral infection;
- active tuberculosis infection that is not being treated;
- herpes infection of the eyes;
- osteoporosis, or low bone mineral density;
- a weak immune system; or
- cataracts, glaucoma, or increased pressure inside your eyes.

It is not known whether this medicine will harm an unborn baby. Tell your doctor if you are pregnant or plan to become pregnant.

Beclomethasone inhalation can pass into breast milk and may harm a
