Tenofovir tablet

What is this medicine?

TENOFOVIR is an antiviral medication that prevents human immunodeficiency virus (HIV) or hepatitis B virus cells from multiplying in your body.

Tenofovir is used to treat HIV, which causes the acquired immunodeficiency syndrome (AIDS). It is not a cure for HIV or AIDS. Tenofovir is also used to treat chronic hepatitis B.

What should I tell my health care provider before I take this medicine?

You should not take Tenofovir if you are allergic to tenofovir. Do not take Tenofovir together with adefovir (Hepsera), or with combination medicines that contain tenofovir.

Tenofovir should not be given to a child with HIV who is younger than 2 years old. This medicine should not be used to treat hepatitis B in a child younger than 12 years old.

To make sure Tenofovir is safe for you, tell your doctor if you have:

- liver disease (especially hepatitis B if you also have HIV);
- kidney disease; or
- low bone mineral density.
- Some people develop a life-threatening condition called lactic acidosis while taking Tenofovir. You may be more likely to develop lactic acidosis if you are overweight or have liver disease, if you are a woman, or if you have taken HIV or AIDS medications for a long time. Talk with your doctor about your individual risk.

FDA pregnancy category B. This medication is not expected to be harmful to an unborn baby, but HIV can be passed to your baby if you are not properly treated during pregnancy. Take all of your HIV medicines as directed to control your infection.

Tenofovir can pass into breast milk and may harm a nursing baby. You
